TITLE: Stratified and faceted forms in panoramas obtained by the Luna-
9 stationSOURCE: AN SSSR. Doklady, v. 170, no. 3, 1966, 560 and insert facing
p. 560TOPIC TAGS: LUNAR PHOTOGRAPHY, SPACE STATION,
SPACE STATION lunar surface, moon, lunar study, lunar station/ Luna-9ABSTRACT: The complicated structures of characteristic and repeated
forms of the lunar surface on panoramic pictures obtained by the
Soviet lunar station "Luna-9" are described. Among these are forms
which can be characterized as complex polyhedrons consisting of small
flat regions. In many places on photographs the boundary between
the light and the shadow consists of straight lines cast by objects
with straight and flat faces. The first figure in the text shows the
blocked structure formed by polyhedrons. The second figure contains
several stratified structures which are bordered by two parallel and
nearly vertical faces of large dimensions. Both ends of these struc-
tures have an irregular shape, but in many cases show indented surfaces.

UDC: 550.2

Card 1/2

L 06165-67

ACC NR: AP6032853

The strata were estimated to be 0.8--1.5 cm thick. The third figure shows a part of the first figure with a prominent rock having an indented surface and funnel-shaped pits. The other part of the fragment consists of rocks with indented surfaces and irregularly shaped sides. Based on the lunar photographs, it is concluded that the lunar surface consists of many stratified rocks. Orig. art. has: 3 figures.

TITLE: AL'FA automatic programming system

SOURCE: Zhurnal vychislitel'noy matematiki i matematicheskoy fiziki, v. 5, no. 2,
1965, 317-325

TOPIC TAGS: automatic computer programming, computer language, computer system,
machine translation, computer/AL'FA computer programming, AL'FA computer,
language, AL'FA computer system

ABSTRACT: This article presents a detailed description of the AL'FA Automatic
Programming System which translates from an ALGOL type language.
The AL'FA System was developed by a group of twelve scientists at the
Computing Center of the Siberian Branch of the Academy of Sciences USSR
and is intended for the electronic computer of the same computing center.

Card 1/3

48598-65

ACCESSION NR: AP5009396

which has the following characteristics: three-address, floating-point, one index register, an immediate access memory of 4096 45-bit words, three magnetic drums with a total storage capacity of 12,288 words, four magnetic tape units with 75,000 words storage capacity each, punch card input and output, average speed 20,000 operations per second.

The AL' FA System consists of the following components: 1) AL' FA language, the input language in which the problems to be solved are programmed. This language is an extension of the ALGOL-60 language. 2) AL' FA translator, the translating program by means of which the program written in AL' FA language is translated into the computer program. It consists of 24 blocks with a total storage capacity of 45,000 words. The performance of particular blocks and translation procedure are described in detail, and 3) the AL' FA debugging program, which makes it possible to correct the AL' FA program without studying the computer program. The storage capacity of the AL' FA debugging program is approximately 2000 words.

Card 2/3

L 48598-65

ACCESSION NR: AP5009396

It is indicated that scientists were working on the development of the AL' FA System from 1958 to 1964 and that the estimated labor used amounts to 35 man-years. The AL' FA System has been in an experimental stage of operation since January 1964. Some operational data obtained in the first five months are presented and compared with the data on manual programming. Orig. art. has 2 tables.

Ropyanaya, M. A.ORG: Volgograd Petroleum and Gas Scientific Research Institute
(Volgogradskiy nauchno-issledovatel'skiy institut nefti i gaza)TITLE: Removal of mercaptan sulfur from kerosine²

SOURCE: Neftepererabotka i neftekhimiya, no. 7, 1966, 13-16

TOPIC TAGS: kerosene, jet fuel, desulfurization, mercaptan

ABSTRACT: A new process has been developed which makes it possible to remove all mercaptan sulfur from kerosine fractions from both low-sulfur and medium-sulfur crudes. The process involves extraction with caustic soda in the presence of methanol; mercaptan sulfur in the treated kerosine does not exceed 0.0005—0.0006%, which is well up to world standards. It is noted that the high content of mercaptan sulfur (as high as 0.01—0.02% versus the 0.005% permitted by the GOST standard) is a very serious problem at many Soviet refineries. In fact, certain refineries have been forced to shut off their production of kerosine because of failure to meet specification as to mercaptan content. Hydrofining is not a practical solution since high capital cost,

UDC: 665.666

L 41075-66

ACC NR: AP6027598

shortage of hydrogen, and high cost of operation preclude its rapid and simultaneous introduction to a large number of plants. In contrast, the new process is simple and can be put on stream in a very short time, permitting kerosine production to be resumed at plants which lack hydrofining equipment and an adequate supply of hydrogen. The process has been proven on a laboratory scale and a flow sheet (given in original article) has been drawn up.

PARASITOLOGY

CZECHOSLOVAKIA

ZMORAY, Ivan; Helminthological Institute of the Slovak Academy of Sciences, Kosice. [Original version not given].

"On the Problems of the Ecological Understanding of Parasite Specificity."

Bratislava, Biologia, Vol 21, No 4, 1966, pp 241 - 245

Abstract /Author's English summary modified/: The generally accepted definitions of parasite specificity are discussed. A basic concept of specificity is presented by the author and mathematical equations expressing this concept are presented. The only specific relationship is that between the host and the parasite. The number of specificities should be reduced so that ecological designation could be narrowed down more precisely. No references. Original article is in German. (Manuscript received 6 Dec 65).

"Catalase Activity in Sexually Adult Females of Ascaris Suum."

Bratislava, Biologia, Vol 21, No 10, 1966, pp 749 - 754

Abstract: The catalase activity of the females of *Ascaris suum* varies to a great extent. The variation is probably due to the age of the helminth. When the material was homogeneous, as far as age is concerned, the activity was a function of body weight. 3 Tables, 2 Western, 1 Czech, 3 Russian references. (Manuscript received 27 Jun 66).

Zmievic, V. A. On the structure formulas of some classes of univalent functions. Doklady Akad. Nauk SSSR (N.S.) 72, 833-836 (1950). (Russian)
The author announces a number of theorems on the class of functions $F(z) = z + \dots$ regular in $|z| < 1$ for which (1) $\Re e^{-iz} F'(z) > 0$ or (2) $\Re e^{-iz} F'(z)/F(z) > 0$. A generalization to the case $|F(z)| \leq M$ is indicated.

The author gives an elementary discussion and simple modifications of the following theorem published by Lobačevskii [Učenye Zapiski Imp. Kazan. Univ. 1834, Kn. II, 167-226]. Let $\sum u_n$ be a series of positive terms for which $u_{n+1} < u_n$ and $u_n \rightarrow 0$. Let k be a positive integer. Then $\sum u_n$ converges if and only if $\sum p_n 2^{-kn}$ converges when the integers p_n are determined by the conditions $U_{p_n+1} < 2^{-kn} u_n \leq U_{p_n}$.

L

Zmorovič, V. A. On structure formulas of certain classes of analytic functions univalent in a circular ring. D. J. lady Akad. Nauk SSSR (N.S.) 86, 465-468 (1952). (Russian)

Single-valued analytic functions $f(z)$, are considered in the annulus $q < |z| < 1$. Such a function is called normed if $\oint f dz/z = 2\pi i$, the integral being extended over $|z| = \rho$, $q < \rho < 1$. Theorem 1 gives a Stieltjes integral representation of normed functions with positive real parts. The formula, generalizing the classical Herglotz representation, reads

$$f(z) = \frac{1}{2\pi} \int_{-\pi}^{\pi} F(ze^{-i\theta}) d\mu_1(\theta) + \frac{1}{2\pi} \int_{-\pi}^{\pi} F\left(\frac{q}{z} e^{i\theta}\right) d\mu_2(\theta) - 1.$$

Here μ_1, μ_2 are non-decreasing real-valued functions and

$$F(z) = \frac{i}{2\pi} \int_{-\pi}^{\pi} \left(\frac{\log z}{z} ; q \right) = \frac{1+z}{1-z} + 2 \sum_{n=1}^{\infty} \frac{q^{2n}}{1-q^{2n}} (z^n - z^{-n}).$$

Using Theorem 1 the author finds integral representations for functions $f(z)$ satisfying the following conditions: $f(z)$ is univalent and maps circles $|z| = \rho$ onto star-shaped curves (Th. 2), $\operatorname{Re} e^{i\alpha} f'(z)/f(z) > 0$ for some real α (Th. 3), $f(z)$ maps circles $|z| = \rho$ into convex curves (Th. 4), $f(z)$ has a simple pole in the annulus and maps the annulus in a one-to-one way onto the complement of two convex bodies (Th. 6). [For similar results in the case of a disc, cf. the paper reviewed above.] L. Bers (New York, N.Y.).

Zmorović, V. A. On some classes of analytic functions univalent in a circular ring. Mat. Sbornik N.S. 32(74), 633-652 (1953). (Russian)

Let $f(z)$ be regular in a ring $K: 0 < q < |z| < 1$, and normalized by the condition that $\int f'(z) z^{-1} dz = 2\pi i$ on $q < r = |z| < 1$. It is proved that a necessary and sufficient condition that $\Re(f(z)) > 0$ in K is that

$$f(z) = \frac{1}{2\pi} \int_{-\pi}^{\pi} F(ze^{-i\theta}) d\mu_1(\theta) + \frac{1}{2\pi} \int_{-\pi}^{\pi} F\left(\frac{2e^{i\theta}}{z}\right) d\mu_2(\theta) - 1,$$

where

$$F(z) = \frac{1+z}{1-z} + 2 \sum_{k=1}^{\infty} \frac{q^{2k}}{1-q^{2k}} (z^k - z^{-k}),$$

and $\mu_j(\theta)$, $j=1, 2$, is a nondecreasing function on $[-\pi, \pi]$ for which $\mu_j(-\pi+0) = \mu_j(-\pi) = 0$ and $\mu_j(\pi) = 2\pi$.

This theorem contains a variety of previously known results as special cases. Application is made to obtain formulas for functions which are regular and univalent in K and (a) convex, (b) starlike, and also for functions meromorphic and univalent in K . A. W. Goodman.

SUBJECT USSR/MATHEMATICS/Theory of functions CARD 1/3 PG - 500
 AUTHOR ZMOROVIC V.A.
 TITLE On the limits of the roots of algebraic polynomials.
 PERIODICAL Uspechi mat. Nauk 11, 5, 179-183 (1956)
 reviewed 1/1957

Let be given the algebraic polynomial

$$(1) \quad P(z) = \sum_{v=0}^n a_v z^v \quad (a_0 \neq 0, a_n \neq 0)$$

with real or complex coefficients. Then the following theorems are valid:

$$1. \text{ For } n \geq 2 \text{ be } R = \max \left\{ \left| \frac{a_k}{a_n} \right|^{\frac{1}{n-k}} \right\}_{k=0}^{k=n-1} \text{ and } R_0 = \max \left\{ \left| \frac{a_k}{a_0} \right|^{\frac{1}{k}} \right\}_{k=1}^{k=n}.$$

Then all zeros of (1) lie in the ring

$$(2) \quad \frac{x}{R_0} \leq |z| \leq \frac{R}{x}$$

where x is the single positive root of $x^{n+1} - 2x + 1 = 0$ being different from 1.
 This root satisfies the inequation

Uspechi mat. Nauk 11, 5, 179-183 (1956)

Card 2/3

PG - 500

$\frac{1}{2} + \frac{1}{2^{n+2}} < x < \frac{1}{2} + \frac{1}{2^{n+1}}$

The limits of (2) are exact: The lower one reaches the polynomial $\sum_{k=0}^{n-1} (R_0 z)^{n-k-1}$
 and the upper one reaches the polynomial $z^n - \sum_{k=1}^n R_k z^{n-k}$.

2. If $R \geq \max \left\{ \left| \frac{a_{n-k}}{a_n} \right|^{\frac{1}{k}} \right\}_{k=1}^{k=n}$, then
 $n \left(\frac{R}{k} \right) \leq \frac{\ln \left[(n+1) \left| \frac{a_n}{a_0} \right| R^n \right]}{\ln k}$,

where $k > 1$ and $n \left(\frac{R}{k} \right)$ is the number of zeros of (1) in the circle $|z| \leq \frac{R}{k}$.

3. Let $\left| \frac{a_k}{a_0} \right| = \delta_k$ ($k=1, 2, \dots, n$). Outside of the circle
 $|z| \leq (1 + \delta_1 + \dots + \delta_n)^{-\frac{1}{n-k}}$ ($k=1, 2, \dots, n-1$)

Uspechi mat. Nauk 11, 5, 179-183 (1956)

APPROVED FOR RELEASE: 03/15/2001

CIA-RDP86-00513R002065320004-9

there lie at least k zeros of (1).

4. Let $Q(z) = 1 + b_1 z + b_2 z^2 + \dots + b_n z^n$ and $1 + |b_1| + \dots + |b_n| = A$. Let $S(A; n)$ denote the class of polynomials $Q(z)$ for fixed n and A . Let $r_k(A, n)$ be the exact upper bound of those numbers $r_k > 0$ for which in the circle $|z| \leq r_k$ there lie not more than $n-k$ zeros of each polynomial of the class $S(A, n)$. For a polynomial of the class $S(A, n)$ holds:

$$r_1(A, n) = (A-1)^{-\frac{1}{n}}$$

With a corresponding restriction, from these theorems one obtains the results of S.K. Singh (Proc. Nat. Inst. Sci. India 19, 5, 601-603 (1953)).

TITLE: On the Theory of Special Classes of Schlicht Functions.II

PERIODICAL: Uspekhi matematicheskikh nauk, 1959, Vol 14, Nr 4, pp 169-172 (USSR)

ABSTRACT: The present paper is a direct continuation of [Ref 1]. The author introduces two classes of functions schlicht and regular in the unit circle $|z| < 1$ containing as very special subclasses the classes treated by Tchakaloff [Ref 2] and Thale [Ref 3]. It is stated that all these classes belong to the "almost convex" functions of Ozaki [Ref 4]. Finally it is proved:Theorem: If $f(z)$ is regular and convex in $|z| < 1$; λ, μ, c are complex numbers, $\mu \neq 0$, $|\arg \frac{\lambda}{\mu}| < \frac{\pi}{2}$, then $F(z) = \lambda f(z) + \mu z f'(z) + c$ is "almost convex" in $|z| < 1$.

The author mentions L.Ye.Dunduchenko, and B.N.Rakhmanov. There are 6 references, 2 of which are Soviet, 1 American, 1 French, 1 Roumanian, and 1 Japanese.

TITLE: On the Theory of Special Classes of Schlicht Functions I

PERIODICAL: Uspekhi matematicheskikh nauk, 1959, Vol. 14, Nr 3,
pp. 137 - 144 (USSR)

ABSTRACT: The author considers certain special classes of schlicht functions, to which there belong in particular the functions convex in a given direction introduced by Robertson [Ref 1], and some function classes of B.N. Rakhamanov [Ref 2]. It is shown that all these classes are subclasses of the class K_0 of the almost convex functions of Ozaki [Ref 3]. The author proves a general theorem on schlicht functions in schlicht domains with an arbitrary connectivity. The theorem on almost convex functions of Ozaki and a theorem of Rogozhin [Ref 4] are obtained as conclusions. Altogether there are three theorems and several conclusions. - There are 5 references, 3 of which are Soviet, 1 American, and 1 Japanese.

TITLE: On the Theory of Special Classes of Unifoliate Functions
(K teorii spetsial'nykh klassov odnolistnykh funktsiy)PERIODICAL: Dopovidi Akademii nauk Ukrains'koi RSR, Nr 1, 1959,
pp 5-9 (USSR)ABSTRACT: This article establishes a few structural formulae of some classes of unifoliate holomorphic functions in a circle $|z| < 1$ of analytic functions, upon which, some of the formulas of L.Tchakaloff [1], Thale [2] and others are based. It also establishes a structural formula for classes L_a^2, L^∞ of B.N. Rakhmanov. Four theorems are examined and proved true. In the process of calculation, the regular function in circle $|z| < 1$, which makes possible identification of the convex function $\varphi(z)$ in that circle, and real number Y , is designated K . Convex functions in circle $|z| < 1$ are called functions of class S . Every stable function on segment

Card 1/2

SOV/21-59-1-2/26

On the Theory of Special Classes of Unifoliate Functions.

$f_{\alpha, \beta}$ is called a function of class M , with a limited variation on that segment, and of class M_h , when it has a variation h . $F(z; \theta)$ stands for continuous function of arguments z and θ when $z \leq p$ and $0 \leq \theta < 2\pi$, at $p < 1$ and is arbitrarily close to 1. Other designations are standard mathematical. There are 7 references, 3 of which are Soviet, 3 English and one Japanese.

TITLE: On Generalization of Schwarz's Integral Formula on n-Connected Circular Domains (Ob obobshchenii integral'noy formuly Shvar-tsa na n-svyasnyye krugovyye oblasti)

PERIODICAL: Dopovidi Akademii nauk Ukrains'koj RSR, 1958, Nr 5, pp 489-492 (USSR)

ABSTRACT: The author finds another form other than Meschkowski's formula for the generalization of Schwarz's formula, which is more convenient for various applications. It looks as follows:

$$f(z) = \frac{1}{2\pi} \sum_{j=1}^n \int_0^{2\pi} u_j(\theta) F_j(z; \xi_j) d\theta - \alpha + i\beta$$

where α and β are real constants and $\alpha = \lambda_k$ ($k = 1, 2, \dots, n$). This formula is a generalization of the Schwarz integral formula on n-connected circular domains, which reduces to the former at $n = 1$. If the boundary of an n-connected domain consists of ordinary closed analytical curves, the formula of the author can be extended to this case by means of a certain auxiliary conformal mapping. Making use of his formula the author establishes the structural formulas for three

Card 1/2

21-58-5-5/28

On Generalization of Schwarz's Integral Formula on n-Connected Circular Domains

important classes of single-valued regular functions in n-connected circular domains, which was not possible to accomplish with the aid of Meschkowski's formula [Ref 1]. There are 5 references, 2 of which are Soviet, 1 German and 2 Finnish.

Zmorovich, V.A.

TITLE:

On a Generalization of Poisson's Integral Formula for
n-Connected Circular Domains (Ob obobshchenii integral'noy
formuly Puassona na n-svyaznye krugovyye oblasti)

PERIODICAL:

Dopovidi Akademii nauk Ukrains'koj RSR, 1958, Nr 7,
pp 698-701 (USSR)

ABSTRACT:

The author considers a unifoliate n-connected domain K_n
whose boundary consists of n-circumferences of \bar{l}_j -circles
described by the equations:

$$\zeta_j = a_j + R_j e^{i\theta} \quad (j = 1, 2, \dots, n; 0 \leq \theta \leq 2\pi).$$

He looks for a formula which can define every regular in
 K_n and continuous in K_n harmonic function in the points of
the circumferences of \bar{l}_j in a form more convenient than
those of Meschkowski (Ref. 1) and Sekki (Ref. 2). The new-
ly found representation looks as follows:

Card 1/3

21-58-7-3/27

On a Generalization of Poisson's Integral Formula for n-Connected Circular Domains

$$u(z) = \frac{1}{2\pi} \sum_{k=1}^n \int_0^{2\pi} u_k(\theta) \operatorname{Re} F_k(z; \xi_k) d\theta - \sum_{k=1}^n \frac{\lambda_k}{\ell_n \eta_k} \theta_n |G'_k(z)|,$$

where $F_k(z; \xi_k)$ ($k = 1, 2, \dots, n$) are unifoliate in \mathbb{C}^n functions introduced by the author (Ref. 3), and

$$\lambda = \frac{1}{2\pi} \sum_{j=1}^n \int_0^{2\pi} u_j(\theta) \ell_{j,K}(\theta) d\theta$$

This is a generalization of the Poisson integral formula for n -connected unifoliate circular domains. Employing this formula, the author proves some general theorems about the integral representations of various classes of analytical and harmonic functions in n -connected circular domains. In particular, a generalized Poisson - Jensen formula is established for n -connected circular domains. There are 3 references, 1 of which is Soviet and 2 Finnish.

On the Theory of Convergence of Positive Numerical Series
(K teorii skhodimosti znakopolozhitel'nykh chislovykh ryadov)

PERIODICAL:

Dopovidzi Akademii nauk Ukrains'koi RSR, 1958, Nr 8, pp 805-809
(USSR)

ABSTRACT:

The author proves four theorems to be used in testing for convergence or divergence of positive numerical series. He shows that in certain cases they can be reduced to the theorems formulated by N.I. Lobachevskiy, V.P. Yermakov, A. Cauchy, O. Schloemilch and N.V. Bugayev. However, a theorem of the latter (Ref. 10) was found to be incorrect, and some conclusions based by Yermakov (Ref. 4) on this theorem are therefore unfounded. In the author's opinion, the theorems proved are of interest from the viewpoint of the general theory of convergence and divergence of numerical series, due to a certain completeness of the results contained in them.

TITLE: On the Possibility of Improving the Clearness of Images Produced by Optical Instruments (Pro mozhlivist' polipshennya chitkosti zobrazen', utvoryuvanykh optychnymy instrumentamy)

PERIODICAL: Dopovidi Akademii Nauk Ukrains'koi RSR, 1957, #4, pp 325-327 (USSR)

ABSTRACT: The clearness of images is essentially restricted by the diffraction properties of an optical system. It is possible to improve this clearness, if characteristics of the optical devices used are assumed to be known.

The article describes a method of such an improvement proposed by Tetel'baum and gives a proof of the uniqueness of the solution deduced by Zmorovich.

The method consists in the solution of an integral equation in n-dimensional space which looks as follows:

$$f(k, v, p) = \iiint_{(S)} F(\ell, \sigma, q) \varphi(k, v, p, \ell, \sigma, q) d\ell, d\sigma, dq.$$

TITLE: On the Possibility of Improving the Clearness of Images Produced by Optical Instruments (Pro mozhlivist' polipshennya chit-kosti zobrazhen', utvoryuvanykh optychnymy instrumentamy)

where \hat{F} is the known function of coordinates k , frequency and other parameters p . This function corresponds to the less clear image of an object and it is found from experimental data (for instance, by the photometry or densitometry of photographs).

The function F which represent an investigated object more clearly is being sought for. The kernel of equation ϕ characterizes diffractional and other properties of the apparatus used, and of the observational conditions.

This method can be applied also to ultrasonic devices, radio-technical tools with directed antennas, spectroanalyzers, etc.

It is expected that the method proposed will make it possible to improve the clearness of images by several times.

On order to find the function F , it is expedient to use an algorithm to be applied in modern high-speed electronic computers or special integrators.

AUTHOR: Zmorovich, V.A. (Kiev) SOV#440 58-1-7/21

TITLE: On Some Questions of the Convergence Theory of Series With Positive Terms (O nekotorykh voprosakh teorii skhodimosti znakopolozhitel'nykh ryadov)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy Ministerstva vysshego obrazovaniya SSSR, Matematika, 1958, Nr 1, pp 60 - 79 (USSR)

ABSTRACT: The author explicitly deals with the older Russian papers of Yermakov [Ref 6-9], Bugayev [Ref 1,2] and Bukreyev [Ref 3-5] concerning the convergence of series. The principal results consist in the proof of the necessity of the convergence condition of Yermakov and in the proof that a convergence criterion of Bugayev is nothing but a special case of a result of Schlömilch [Ref 13].

Let the function $f(x)$ be unique, positive and continuous on $[1, + \infty)$; the integral

$$\int_1^{\infty} f(x)dx \text{ and the series } \sum_{k=1}^{\infty} f(k) \text{ are}$$

assumed to converge or diverge simultaneously.

Let $\theta(x) \in E$ denote that there exists an $a > 0$, so that $\theta(x)$

Card 1/3

On Some Questions of the Convergence Theory of Series With Positive Terms SOV/140 -5B-1-7/21

is continuously differentiable on $[a, + \infty]$, $\theta'(x) > 0$, $\theta(x) > x$. Let a property A be called almost immediately satisfied on $(a, + \infty)$, if it is satisfied on $[b, + \infty)$, $b > a$. With these denotations the above mentioned completion of the theorem of Yermakov [Ref 6] reads as follows:

Theorems For the convergence (Divergence) of the series

$$\sum_{k=1}^{\infty} f(k)$$

it is necessary and sufficient that there exists a $\theta(x) \in E$ and an α , $0 < \alpha < 1$, (an $A > 1$), so that on $[1, + \infty]$

$$\begin{aligned} f(\theta(x))\theta'(x) &\leq \alpha f(x) \\ (f(\theta(x))\theta'(x)) &\geq A f(x) \end{aligned}$$

is satisfied almost immediately.

Altogether the paper contains 7 definitions, 7 lemmata and 10 theorems which in most cases are slight modifications of well-known results. The last two sections have a somewhat polemic character and deal with the investigation of Ostrovschi [Ref 14] published some years ago.
